Waterlogging tolerance
- ▶ 耐盐碱  
Salt and alkali resistance
- ▶ 产量高  
High yield
- ▶ 再生性好  
Good regeneration

- 2019全国高粱种植面积: 928.1万亩
- 2019全国高粱总产值: 290.9万吨
- Sorghum Planting Area in China in 2019: 928.1 mu
- Total output value of Sorghum in China in 2019: 290.9 million tons

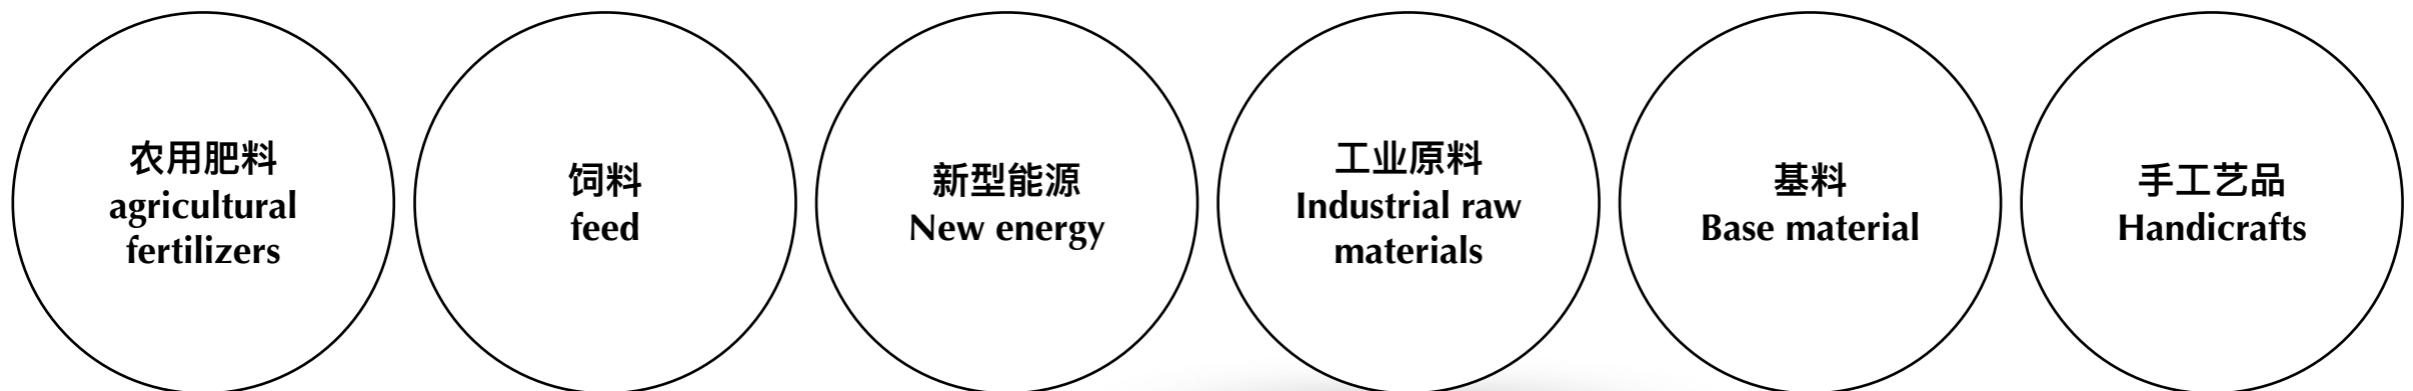

我国秸秆综合利用处于两难境地，解决的关键就在于规模化和运营模式创新，如果能转化我国每年7亿多吨秸秆的50%，将是一个巨大的新兴产业；若能创建以秸秆为原料的新型生态工业，实行建材业种植业、养殖业、农副产品加工业、秸秆生态工业四业相结合的生态农业的生产模式、生物液体燃料、有机肥、生物饲料等都是秸秆转化的产物，那将是一种新型的产业模式

China's comprehensive utilization of straw is in a dilemma. The key to solve this problem lies in the innovation of scale and operation mode. If we can transform 50% of China's more than 700 million tons of straw every year, it will be a huge emerging industry; if we can create a new type of ecological industry based on straw, we will implement the combination of construction industry, planting industry, breeding industry, agricultural and sideline products processing industry and straw ecological industry Agricultural production mode, biological liquid fuel, organic fertilizer, biological feed and so on are the products of straw conversion, which will be a new industrial model

## Sorghum

传统处理方式  
Traditional treatment

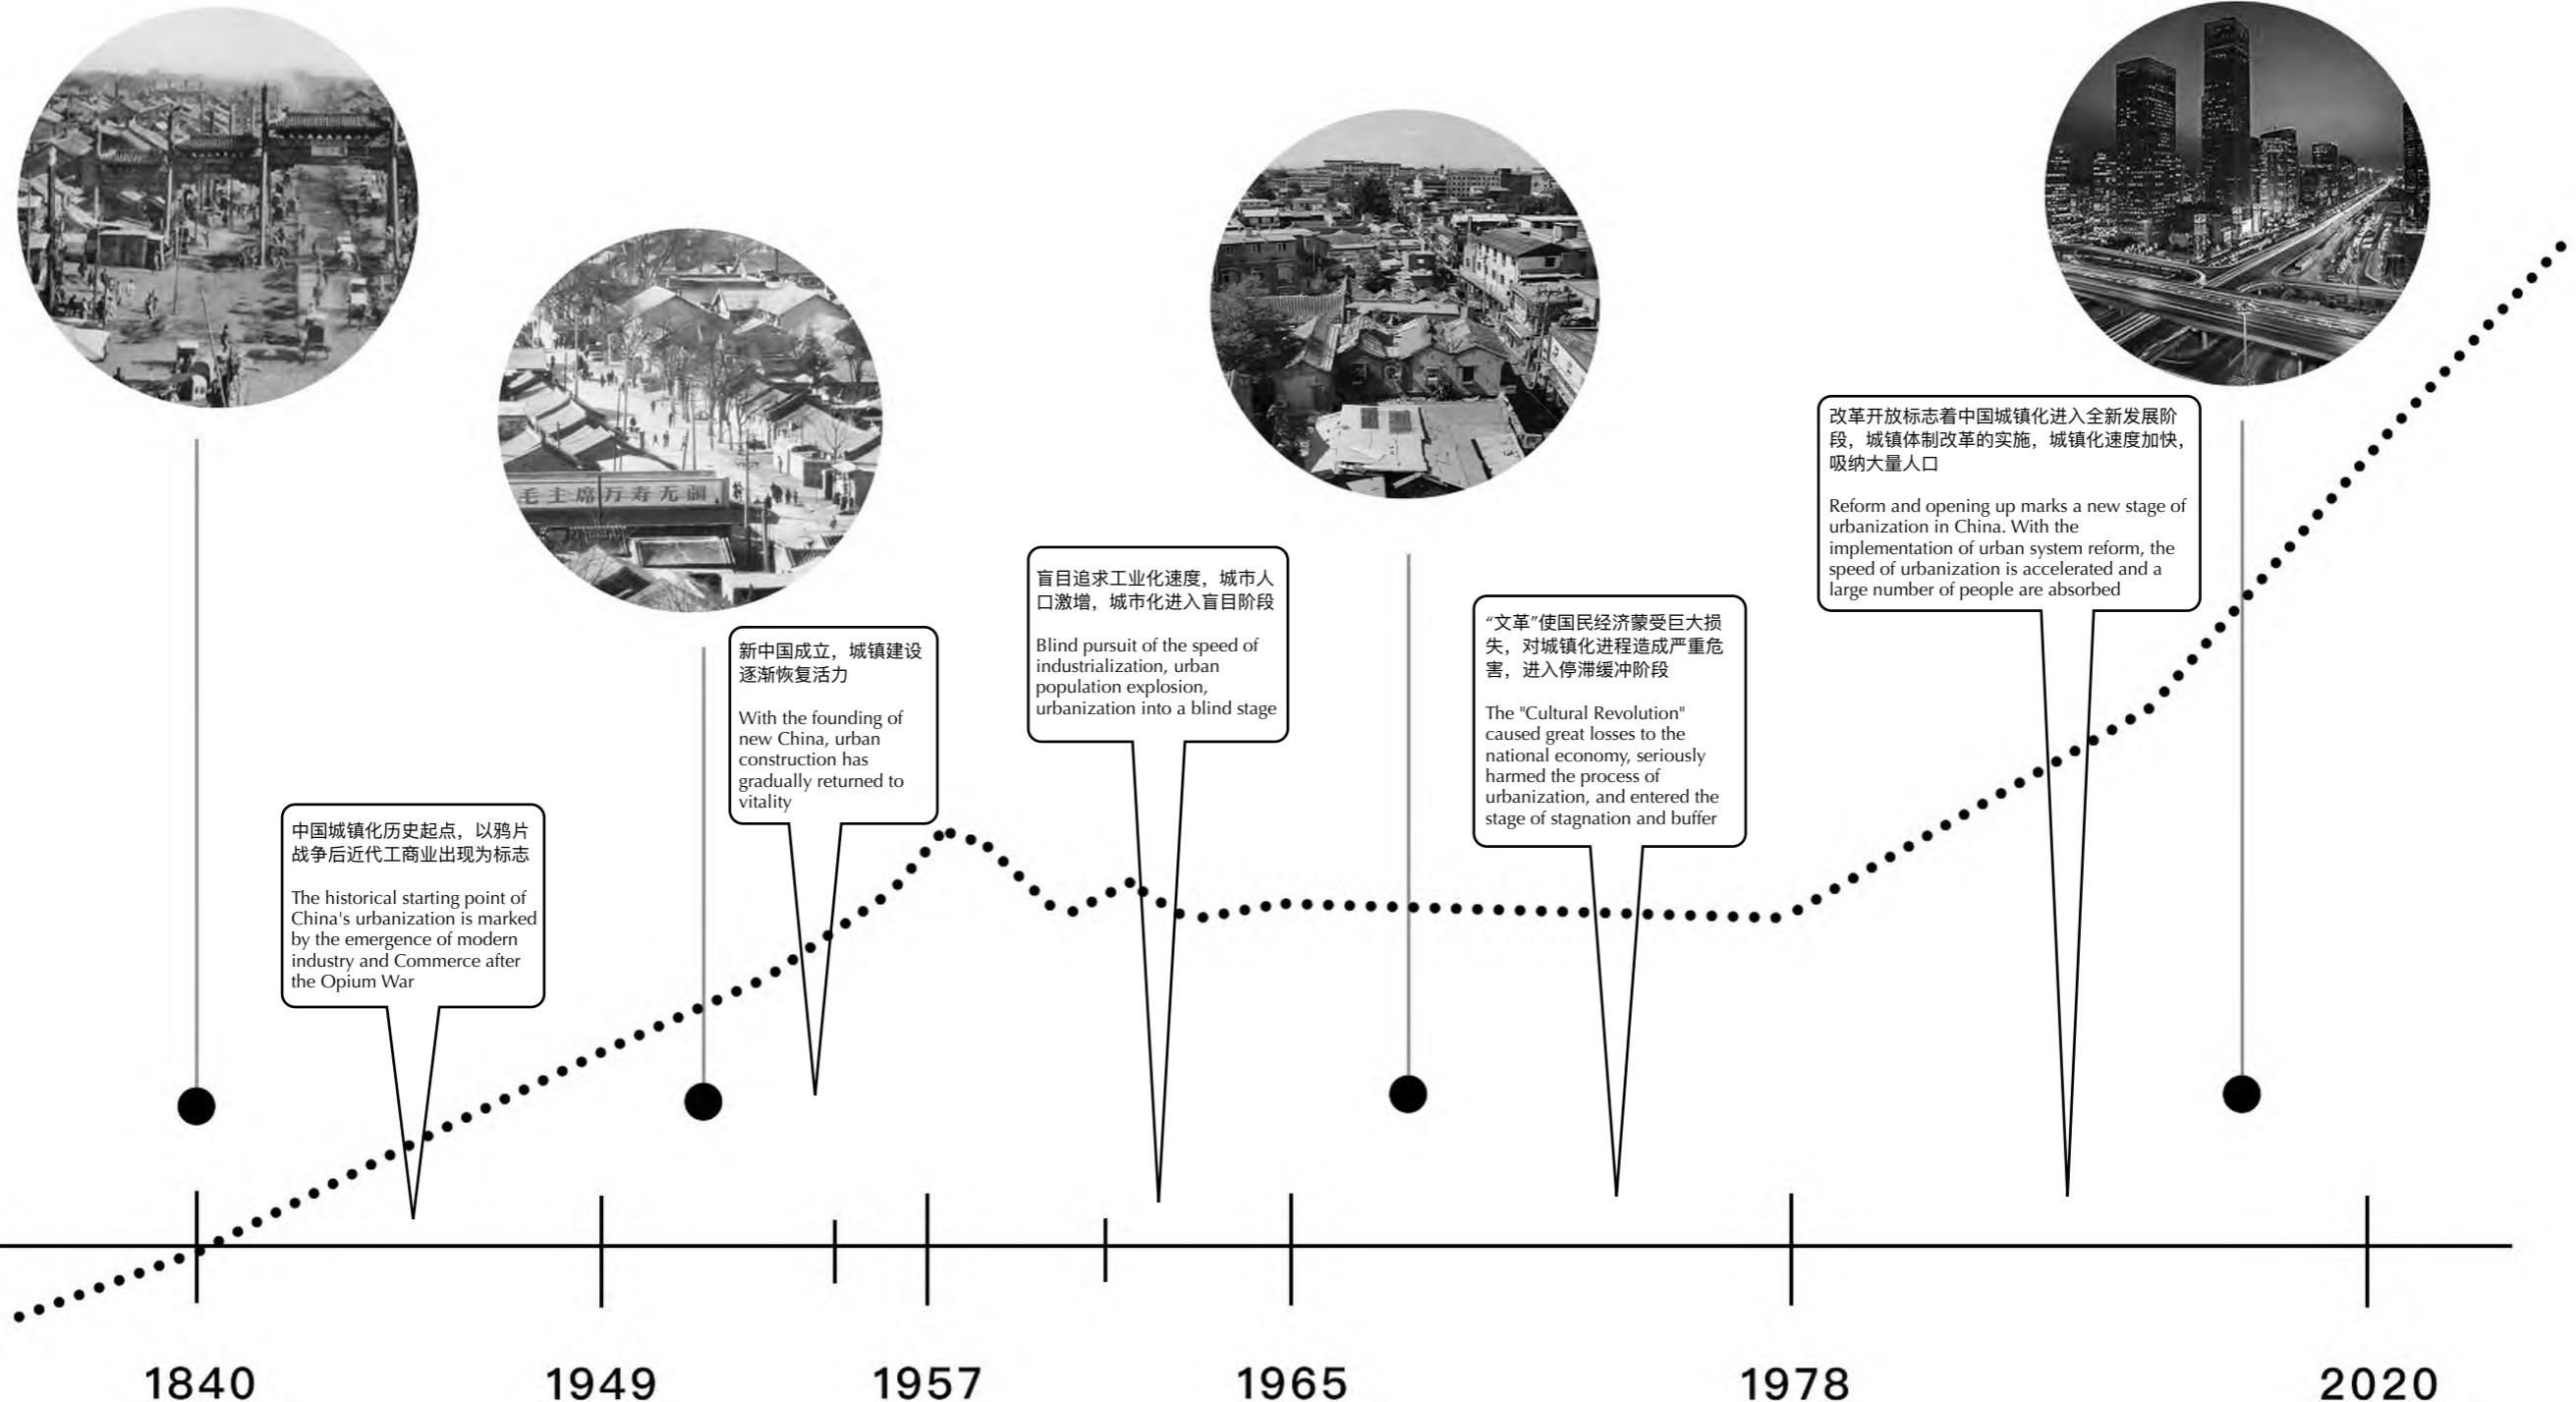

北京故宫博物院，由于国庆期间华北地区焚烧秸秆，排放污染物增加，10月4日至7日遭遇严重雾霾天气，PM2.5浓度突破300微克每立方米，部分地区能见度不足100米。受冷空气和偏北风影响，10月8日雾霾消散，空气质量达到优良水平。

Beijing Palace Museum, due to the burning of straw in North China during the National Day period, increased emissions of pollutants. From October 4 to 7, the concentration of PM2.5 exceeded 300 micrograms per cubic meter, and visibility in some areas was less than 100 meters. Affected by the cold air and northerly wind, the haze disappeared on October 8, and the air quality reached an excellent level.

# 中国城镇化建设进程 The process of urbanization in China

恢复和稳步发展阶段

调整和停滞阶段

快速发展阶段

中国环联此前的调查结果显示，我国在城市建设施工过程中产生的垃圾数据总量已占城市垃圾总量的30%-40%，成为一大城市垃圾园。目前我国建筑废弃物资源化率不足5%，而欧盟国家每年资源化率超过90%，韩国日本资源化率甚至高达95%以上。

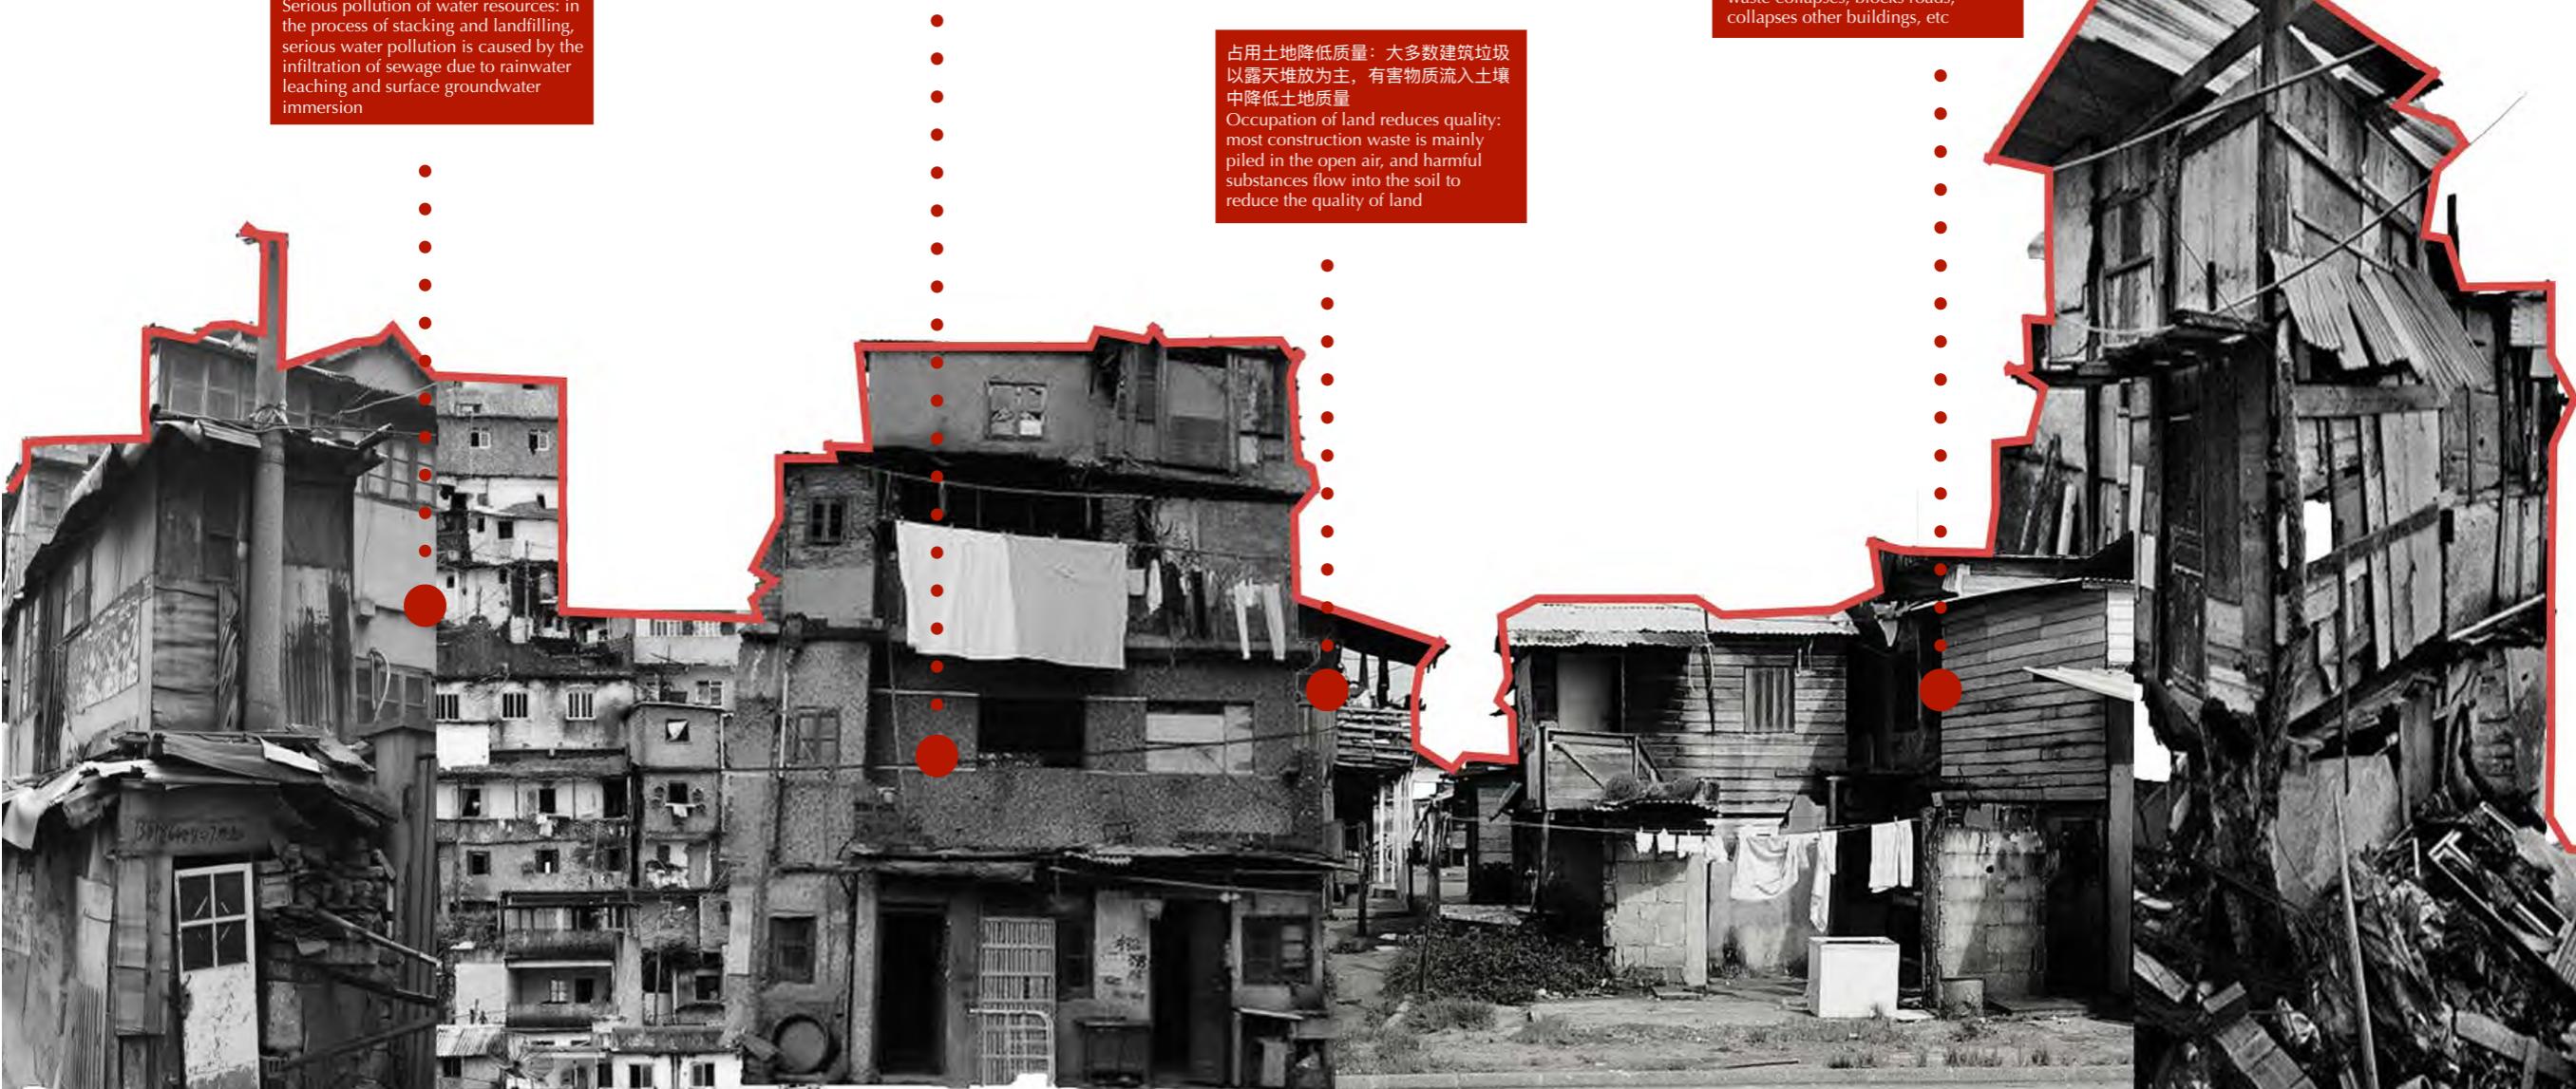

According to the previous survey results of China Environmental Union, the total amount of waste data generated in the process of urban construction in China has accounted for 30% - 40% of the total amount of urban garbage, becoming a large urban garbage garden. At present, the recycling rate of construction waste in China is less than 5%, while that of EU countries is more than 90%, and that of South Korea and Japan is more than 95%.

严重污染水资源：堆放填埋等过程中，由于雨水淋溶冲刷以及地表地下水浸泡而渗滤的污水造成严重的水污染  
Serious pollution of water resources: in the process of stacking and landfilling, serious water pollution is caused by the infiltration of sewage due to rainwater leaching and surface groundwater immersion

影响空气质量：有机物分解产生有害气体  
Impact on air quality: harmful gas produced by decomposition of organic matter

安全隐患：建筑垃圾崩塌，阻碍道路，崩塌其他建筑物等  
Potential safety hazard: construction waste collapses, blocks roads, collapses other buildings, etc

# 联合国可持续发展目标 Sustainable Development Goals

# SUSTAINABLE DEVELOPMENT GOALS

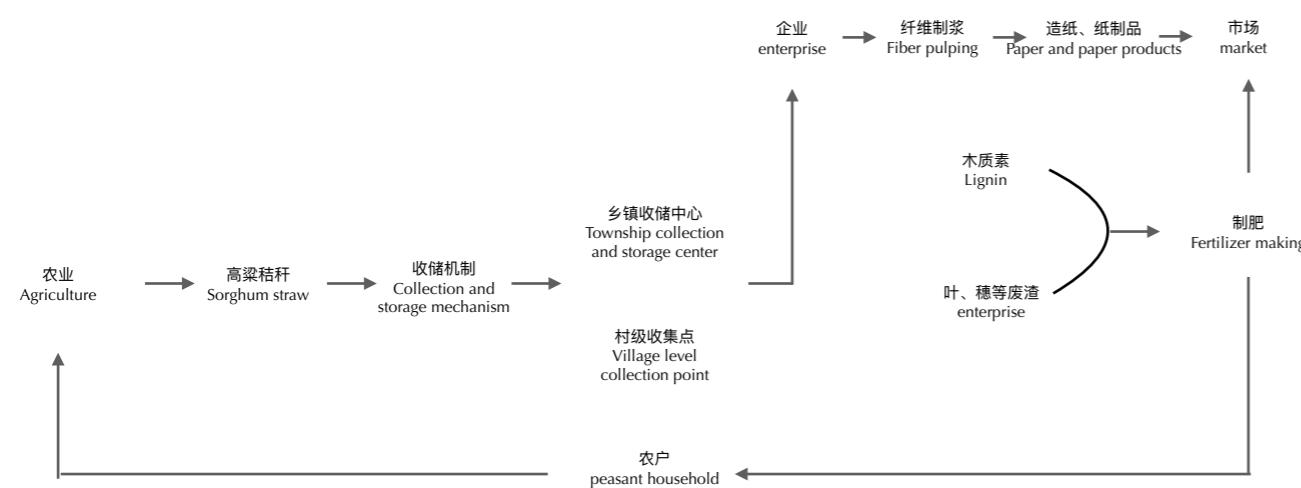

2015年9月25日，联合国可持续发展峰会在纽约总部召开，193个成员国正式通过17个可持续发展目标。旨在从2015年到2030年间以综合方式彻底解决社会、经济和环境三个维度的发展问题，转向可持续发展道路。

On September 25, 2015, the United Nations Sustainable Development Summit was held in New York headquarters, and 193 Member States officially adopted 17 sustainable development goals. From 2015 to 2030, it aims to solve the development problems of social, economic and environmental dimensions in an integrated way, and turn to the sustainable development path.

# 泉林纸业

## Quanlin paper industry

循环经济中的秸秆在前端环节的痛点问题

- 秸秆难收集的关键是没好去处
- 时间短（举例：从麦收到玉米种下只有十天时间）

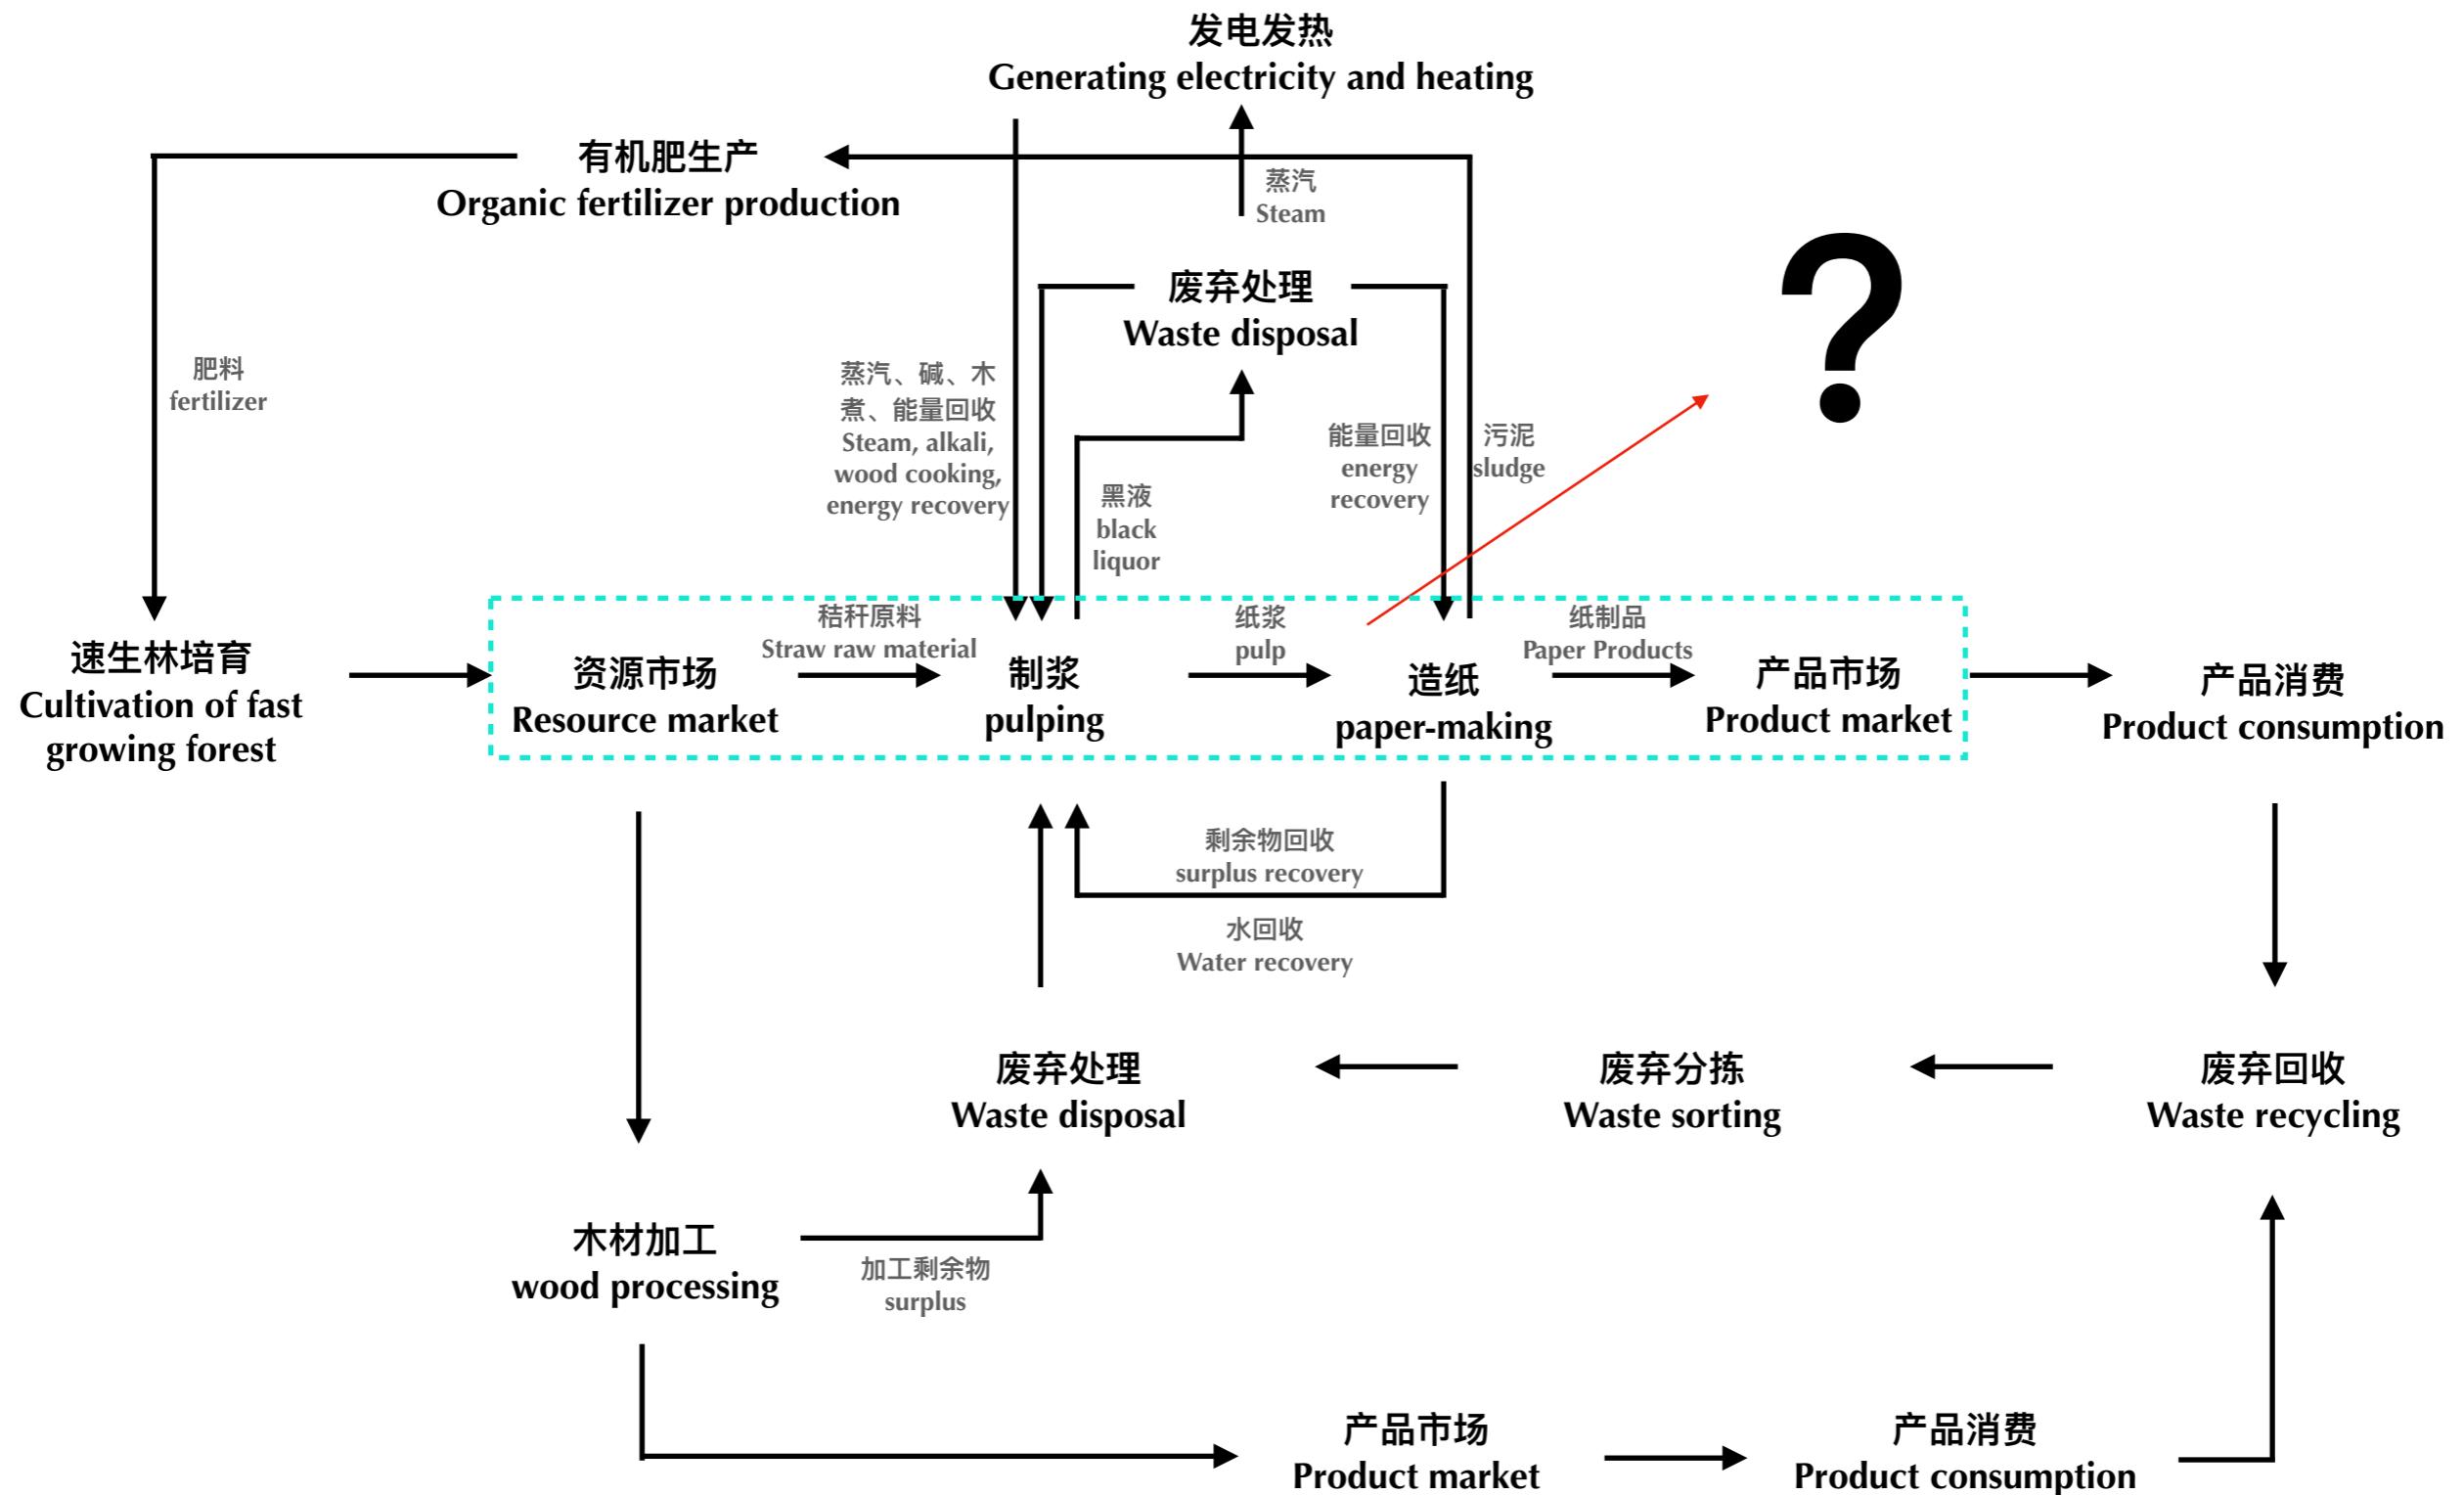

The pain point of straw in the front link of circular economy

- The key to difficult collection of straw is that there is no good place to go
- Short time (e.g. only 10 days from wheat harvest to corn planting)

# 高粱秸秆—特性

## sorghum straw—characteristic

**表 1 几种主要禾草类原料纤维长宽的比较**

种类	一般长度( mm )	一般宽度( $\mu\text{m}$ )	长宽比值
高粱秆	0.726 ~ 2.235	9 ~ 14	127.0
稻草	1.14 ~ 1.52	6 ~ 9	113.7
麦草	1.71 ~ 2.30	17 ~ 19	
芦苇	0.92 ~ 1.52	9 ~ 19	约 120
甘蔗渣	1.5 ~ 2.0	15 ~ 25	63
龙须草	0.636 ~ 2.706	53 ~ 198	202

(武恩吉整理,1981)

高粱茎叶中含有14%-18%的纤维素,是造纸的好原料,纤维细胞越细越长并富有绕曲性和柔韧性,越适合做造纸原料,高粱的纤维细胞长度与宽度之比优于芦苇,甘蔗渣相当于稻、麦而次于龙须草,因此高粱茎叶造纸的利用价值是较高的。

Sorghum stems and leaves contain 14% - 18% cellulose, which is a good raw material for paper-making. The thinner and longer the fiber cells are, the more flexible and flexible they are. The ratio of length to width of bright fiber cells is better than that of reed. Sugarcane bagasse is equivalent to rice and wheat and inferior to Eulaliopsis binata. Therefore, the utilization value of sorghum stem and leaf paper-making is higher.

**表 2 常用禾草类造纸原料化学组成成分**

种类	抽取物( % )				果胶 ( % )	多缩戊糖 ( % )	蛋白质 ( % )	木质素 ( % )	纤维素 ( % )
	冷水	热水	乙醚	NaOH					
高粱秆	8.08	13.88	0.10	25.12	-	24.40	1.81	22.52	39.70
小麦秆	5.36	23.15	0.51	44.56	0.30	25.56	2.30	22.34	40.40
玉米秆	10.65	20.40	0.56	45.62	0.45	24.58	3.83	18.38	37.68
稻草	6.85	28.50	0.65	47.70	0.21	18.06	6.04	14.05	36.20
甘蔗渣	7.63	15.88	0.85	26.26	0.26	23.51	3.42	19.30	42.16

(中国科学院植物研究所,1978)

**表 3 高粱茎叶中不同部位的化学成分分析**

部位	灰分 ( % )	树脂 ( % )	乙醇抽取物 ( % )	纤维素 ( % )	木质素 ( % )	蛋白质 ( % )	乙酸基 ( % )	铜价
全秆	7.65	1.19	10.26	48.83	20.12	0.34	5.62	8.05
节间	4.89	0.84	7.65	49.98	19.68	0.31	5.57	-
表皮	4.13	0.79	9.89	50.29	18.98	0.28	-	4.09
叶部	10.38	1.56	6.05	43.23	21.93	0.59	-	8.25
节部	6.99	1.65	11.61	37.12	16.38	0.37	-	17.29
髓部	4.88	1.12	13.51	42.99	16.19	0.58	-	19.36

(广灌保,1943)

高粱不同品种之间,同一品种茎秆与叶片、茎秆不同部位之间,其纤维细胞长度和宽度都是有区别的。通常茎秆表皮的纤维是最优造纸原料,叶片次之,节部硅质化程度高,髓部纤维较短,造纸价值较低。

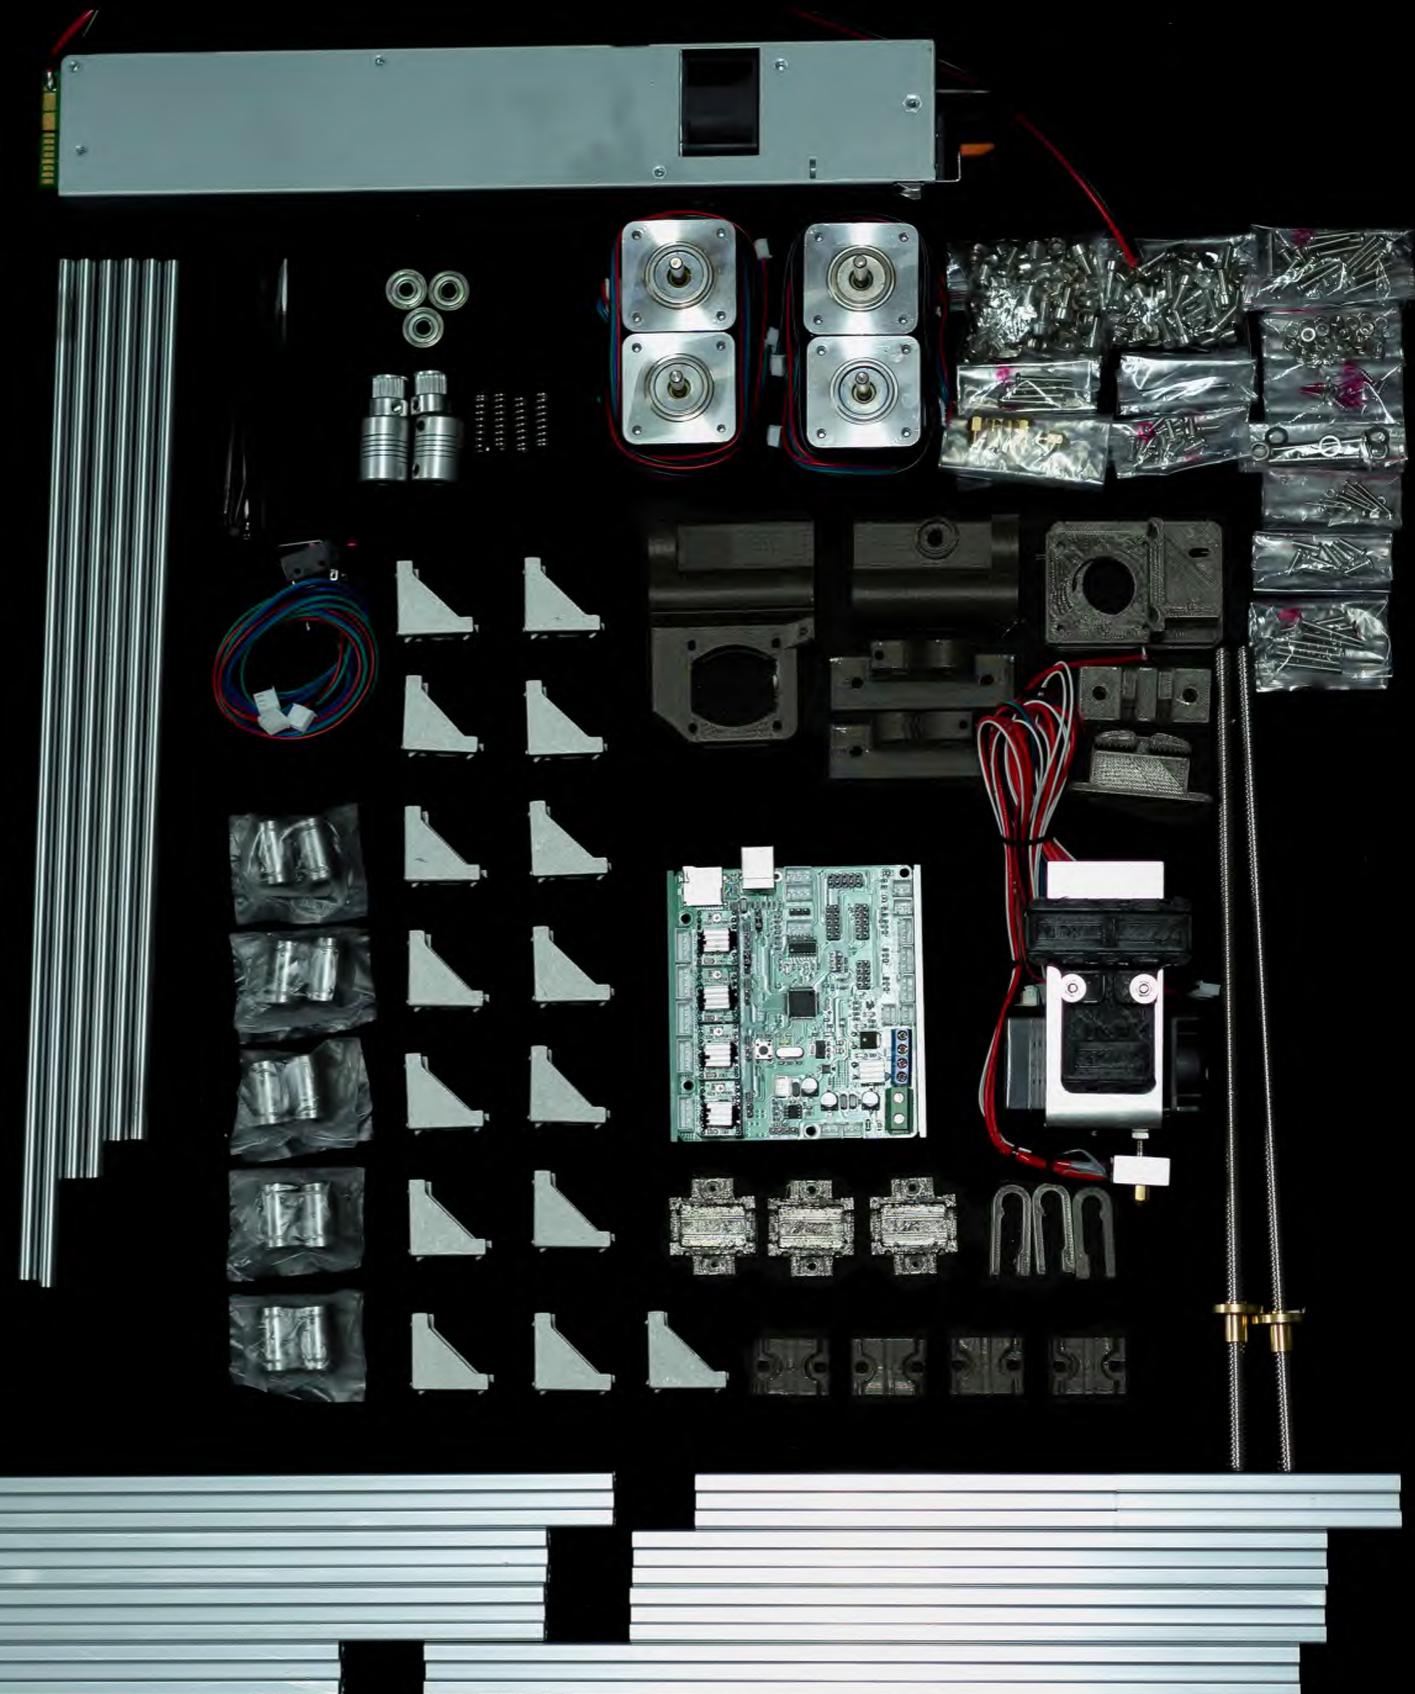

Among different sorghum varieties, the length and width of fiber cells of the same variety are different from that of leaves and stems of the same variety. In general, the fiber of stem epidermis is the best raw material for paper-making, followed by leaves, with high silicification degree in node, short fiber in pulp, and low paper-making value.

系统效应—自下而上的设计

System effect - bottom up design

## 系统效应—自下而上的设计

### System effect - bottom up design

Step1

从通轴步进电机(4针电线旁边)上卸下两个M3螺栓，  
然后把2 x M3 30mm的螺栓安装到3D打印的风扇上。  
Remove the two m3 bolts from the through axis stepper motor  
(next to the 4-pin wire) and install the 2 x m3 30mm bolts to the 3D printing fan

Step2

使用2个X M3 10mm螺栓安装40mm的冷却风扇。

该风扇将用于在打印过程中冷却步进电机。

Install the 40mm cooling fan with 2 x m3 10mm bolts.

The fan will be used to cool the stepper motor during printing.

Step3

从风扇中伸出2针电线, 长度与步进电机的4芯电线相同。

使用电缆包和拉链系统整理电线, 可以顺便将导线焊接在一起。

Extend 2-pin wire from fan, same length as 4-core wire of stepper motor.

Use cable bags and zipper systems to organize wires,  
which can be soldered together by the way.

## 系统效应—自下而上的设计

### System effect - bottom up design

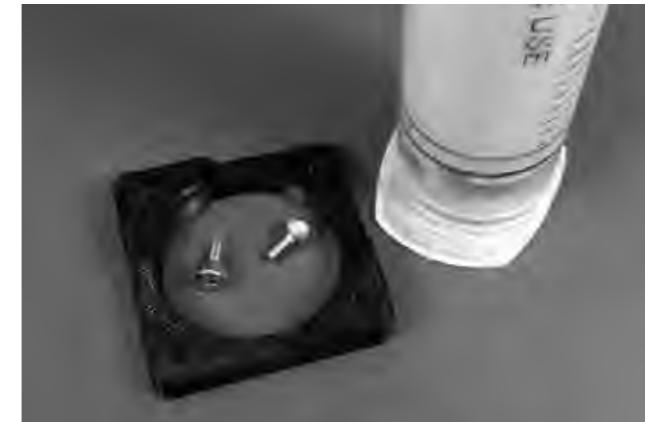

Step4

准备3D打印活塞、60cc注射器的橡胶柱塞和步进电机的螺纹轴，然后把它们组装起来，放入步进电机。

Prepare 3D printing piston, rubber plunger of 60cc syringe and threaded shaft of stepper motor, then assemble them and put them into stepper motor.

Step6

用抹刀等工具将粘土装入注射器，挤出机就准备好了。

Use a spatula and other tools to put the clay into the syringe, and the extruder is ready.

Step5

准备3D打印的注射器支架和2 X M3 6mm的螺栓，用螺栓固定注射器筒。

Prepare 3D printed syringe holder and 2 x m3 6mm bolts, Secure syringe barrel with bolt.

Step7

要使挤出机正常打印，就需要进行一些测试来调整设置，例如打印速度、给料速度、层高和粘土粘度等等。

To make the extruder print properly, you need to do some tests to adjust the settings, Such as printing speed, feeding speed, layer height and clay viscosity, etc.

45g cement + 70ml water

F-032

12g秸秆原料+45g淀粉+  
20g糯米粉+10g乳胶+10g水泥+30ml水  
12g straw + 45g starch +  
20g glutinous rice powder +  
10g latex + 10g cement + 30ml water

流动性好,成膜性高,成型快,可从针管挤出,材质较硬,承重力较好。是目前成为3D打印建材材料可行性最高的一组。

F-036

12g秸秆原料+45g淀粉+  
20g糯米粉+10g乳胶+30g水泥+70ml水  
12g straw + 45g starch +  
20g glutinous rice powder +  
10g latex + 30g cement + 70ml water

流动性好,成膜性高,成型快,但较难从针管挤出,材质较硬,承重力强。若要成为3D打印建材材料需对机器挤出头送料部分进行改造。

F-034

12g秸秆原料+45g淀粉+  
20g糯米粉+10g乳胶+20g水泥+50ml水  
12g straw + 45g starch +  
20g glutinous rice powder +  
10g latex + 20g cement + 50ml water

流动性一般,成膜性高,成型快,不可从针管挤出,材质较硬,承重力强。成为3D打印建材材料可行性较低。

F-038

12g秸秆原料+45g淀粉+  
20g糯米粉+10g乳胶+40g水泥+90ml水  
12g straw + 45g starch +  
20g glutinous rice powder +  
10g latex + 40g cement + 90ml water

流动性差,成膜性一般,成型快,不可从针管挤出,材质较硬,承重力一般。成为3D打印建材材料可行性较低。

# 高粱秸秆3D打印运用场景

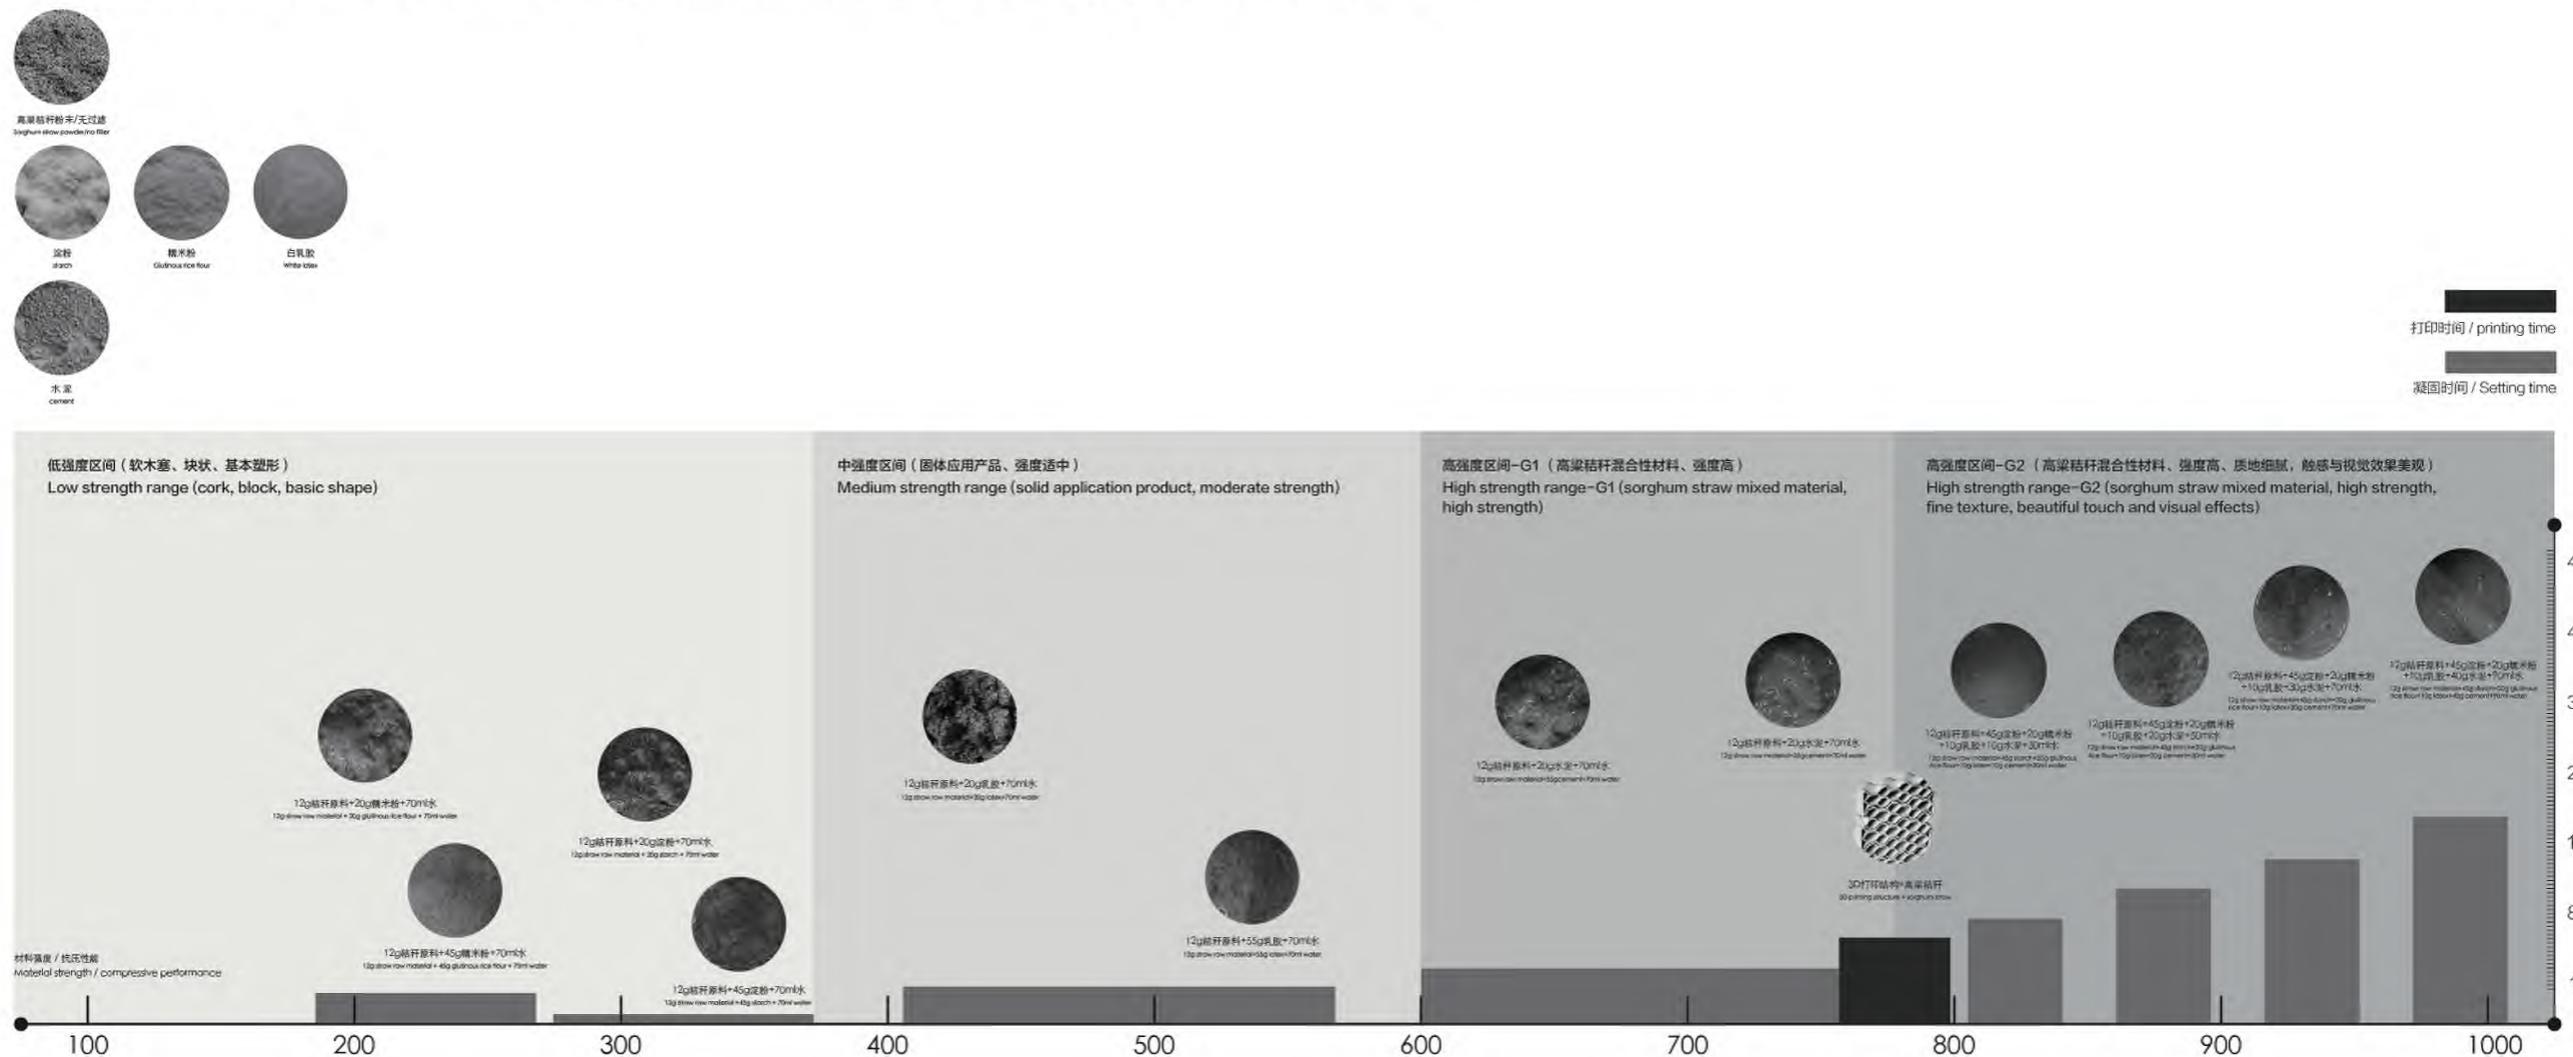

## Sorghum straw 3D printing application scenarios

### 场景核心定位 / Scene core positioning

在整个设计推进的过程中我们都在围绕着高粱秸秆蓝色循环经济的系统模式进行不断的探索与分析。而这些高粱秸秆的背后一定会归结到一个“地方”（place）。毋庸置疑，我们选择回归到高粱秸秆的源头产地 --- 乡村。以期在乡村的诸多生产架构、组织架构中发挥高粱秸秆3D打印技术的可持续性、功能性。帮助乡村在处理高粱秸秆问题上得到最优质的解决方案。

In the whole process of design advancement, we are constantly exploring and analyzing the system model of sorghum straw blue circular economy. And behind these sorghum stalks must be attributed to a "place". Undoubtedly, we chose to return to the source of sorghum stalks --- the countryside. In order to give play to the sustainability and functionality of sorghum straw 3D printing technology in many production structures and organizational structures in the countryside. Helping villages to get the best quality solution to the problem of sorghum straw.

### 材料与应用场景的关系 / The relationship between materials and application scenarios

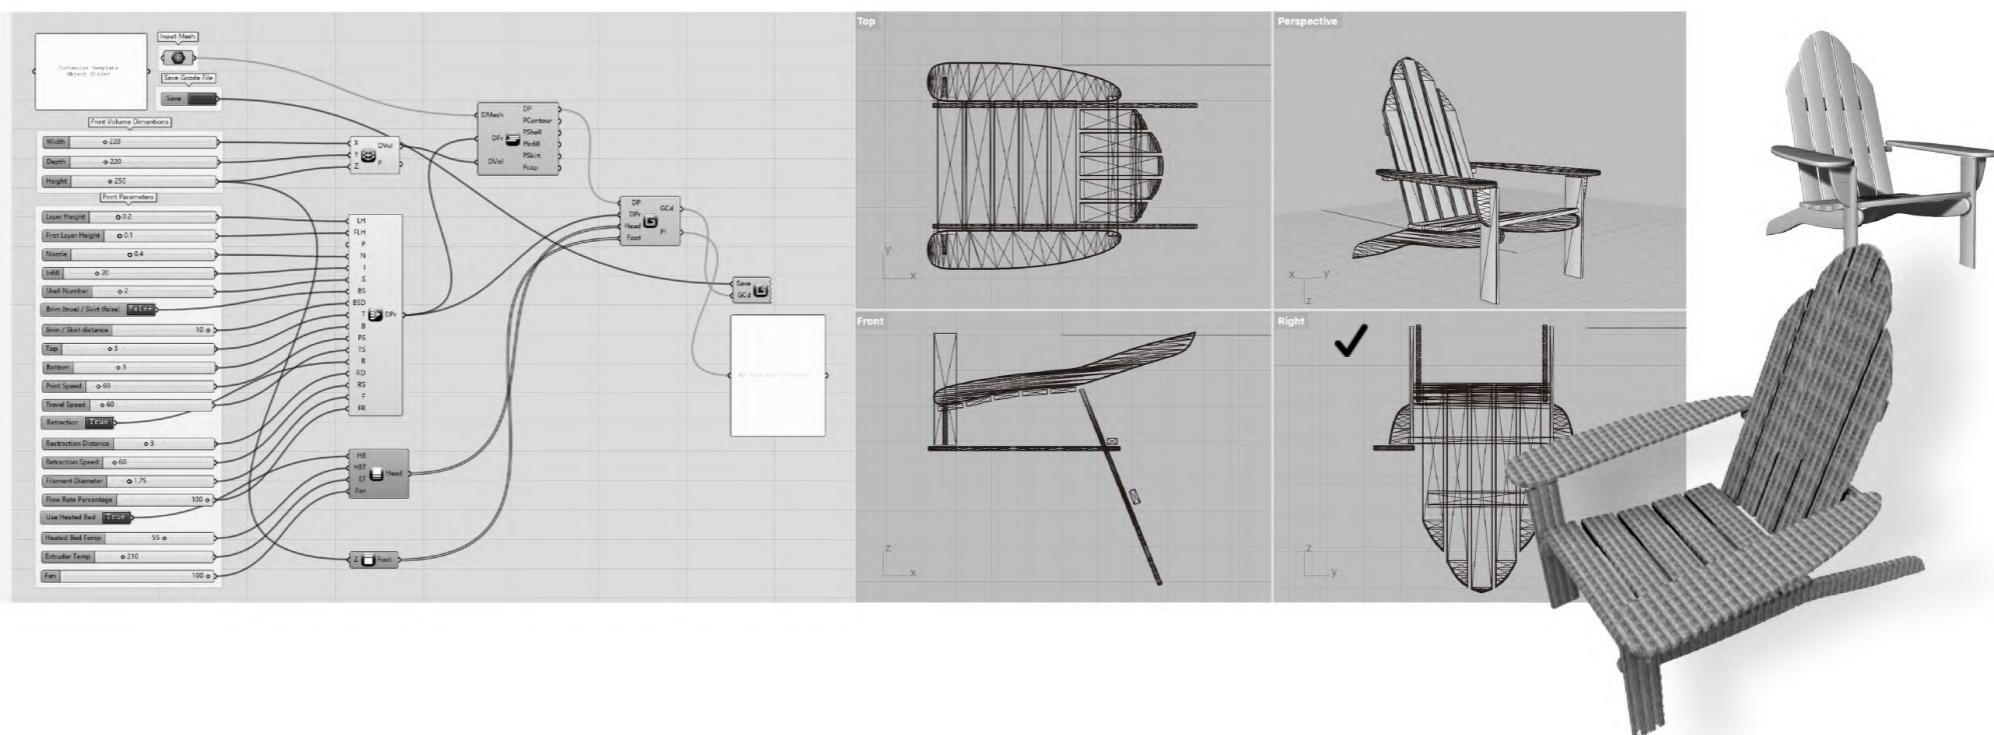

## grasshopper与高粱桔秆3D打印运用场景

## Grasshopper and sorghum straw 3D printing application scene

在本设计当中，我们完成了高粱3D打印原型机的组装、测试以及打印，能够实现在28\*16\*42的立体区间里面的物体打印。在通过大量的材料试验以及桔秆打印模拟之后，我们论证了高粱桔秆3D打印技术应用的可能性与合理性。我们通过在原型机中总结的材料实验结果、打印控制程序，利用grasshopper技术的参数模拟，能够实现更大型高粱桔秆3D打印机器的构建以及打印物体的实际操作。给下一阶段高粱桔秆3D打印机器的迭代做了技术的测试。我们由此可得出，通过本设计的方法、实验可以实现更广泛区域、体积物体的打印与实操。

In this design, we have completed the assembly, testing and printing of the sorghum 3D printing prototype, which can print objects in the 28\*16\*42 three-dimensional interval. After a large number of material tests and straw printing simulations, we demonstrated the possibility and rationality of the application of sorghum straw 3D printing technology. Through the material experiment results summarized in the prototype, the printing control program, and the parameter simulation of the grasshopper technology, we can realize the construction of a larger sorghum straw 3D printer and the actual operation of the printed object. The next stage of the iteration of the sorghum straw 3D printer was tested. From this we can conclude that the printing and practical operation of a wider area and volume objects can be achieved through the method and experiment of this design.

## 高粱桔秆3D打印运用场景

## Sorghum straw 3D printing application scenarios

### 低强度区间（软木塞、块状、基本塑形） Low strength range (cork, block, basic shape)

在此区间的材料具备了固体成形的属性，但是抗压强度与韧性有限，糯米粉与淀粉的实验方案所得出的样品呈现表面质地光滑细腻等特点，打印和挤出过程流畅因此被用来制作和运用的相关场景因匹配其配比简单、塑形能力强、时间短、无需反复抗压等特点。

The materials in this range have the properties of solid forming, but the compressive strength and toughness are limited. The samples obtained from the experimental program of glutinous rice flour and starch present the characteristics of smooth and fine surface texture. The printing and extrusion process is smooth. Therefore, the related scenes used for production and application match the characteristics of simple ratio, strong shaping ability, short time, and no need to repeatedly resist pressure.

饲料、燃烧物、田间稻草人、固态材料与储藏  
Fodder, burning material, field scarecrow, Solid materials and storage

居家可持续制造 - 图纸 - 生活用品 - 家具产品  
Sustainable home manufacturing-drawings-daily necessities-furniture products

### 中强度区间（固体应用产品、强度适中） Medium strength range (solid application product, moderate strength)

乳胶的强粘合性特点使得材料的抗压能力，塑形能力得到了增强。在使用桔秆原料做为打印原材料、乳胶做为添加剂的配比之下，此方案的应用面积以及制作成本是材料实验中最突出的方案。在运用场景中的选择以及运用维度都相比其他材料具有一定的优势。

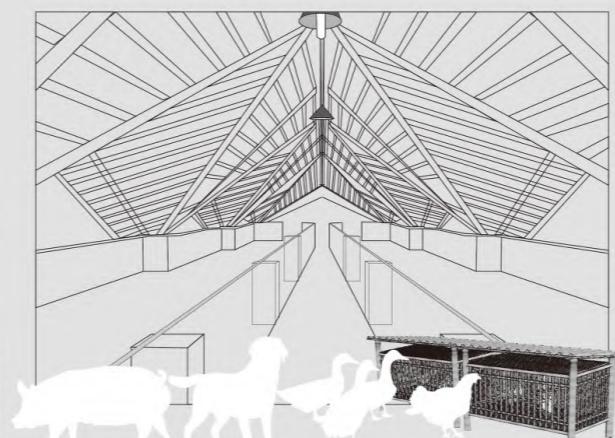

The strong adhesion characteristics of latex make the material's compression resistance and shaping ability enhanced. Under the ratio of using straw as printing material and latex as additive, the application area and production cost of this scheme are the most prominent in the material experiment. The selection and application dimensions in the application scenarios have certain advantages over other materials.

农业 - 农具 / 养殖畜牧业 - 养殖场地  
Agriculture-Farm Tools / Livestock Farming-Breeding Site

我们选择在农业种植之后的废料与废料继续回馈到农业畜牧业之中做为运用场景之一，通过畜牧养殖空间的调研，能够发现在对待畜牧养殖空间时，传统的建造方式在成本、灵活性、环保性以及功能属性上都存在诸多弊端。通过本设计我们可以扩大对于高粱桔秆的3D打印尺度来满足其中需求。

We chose to continue to feed back the waste and waste materials after agricultural planting to the agriculture and animal husbandry as one of the application scenarios. Through the investigation of the animal husbandry space, we can find that the traditional construction method is cost and flexibility when treating the animal husbandry space. There are many disadvantages in environmental protection and functional attributes. Through this design, we can expand the 3D printing scale of sorghum straw to meet the needs.

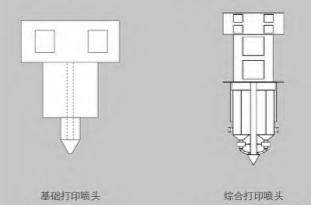

### 高强度区间（建筑材料、支撑架构原材料） High-strength range (building materials, supporting structure raw materials)

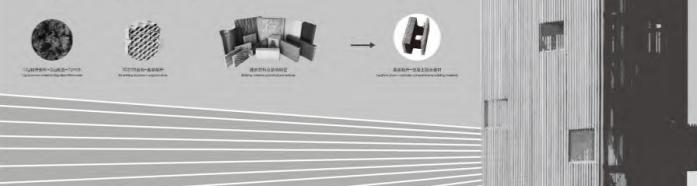

当桔秆材料实验中加入适量水泥时，我们发现其干燥的时间大幅增加，同时其抗压性测试强度也大幅增加，能够在与桔秆材料相配合的情况下做为建筑材料来使用。

When an appropriate amount of cement is added to the straw material experiment, we found that its drying time has been greatly increased, and its compressive strength test strength has also been greatly increased. It can be used as a building material when matched with the straw material.

农业 - 农具 / 养殖畜牧业 - 养殖场地

Agriculture-Farm Tools / Livestock Farming-Breeding Site

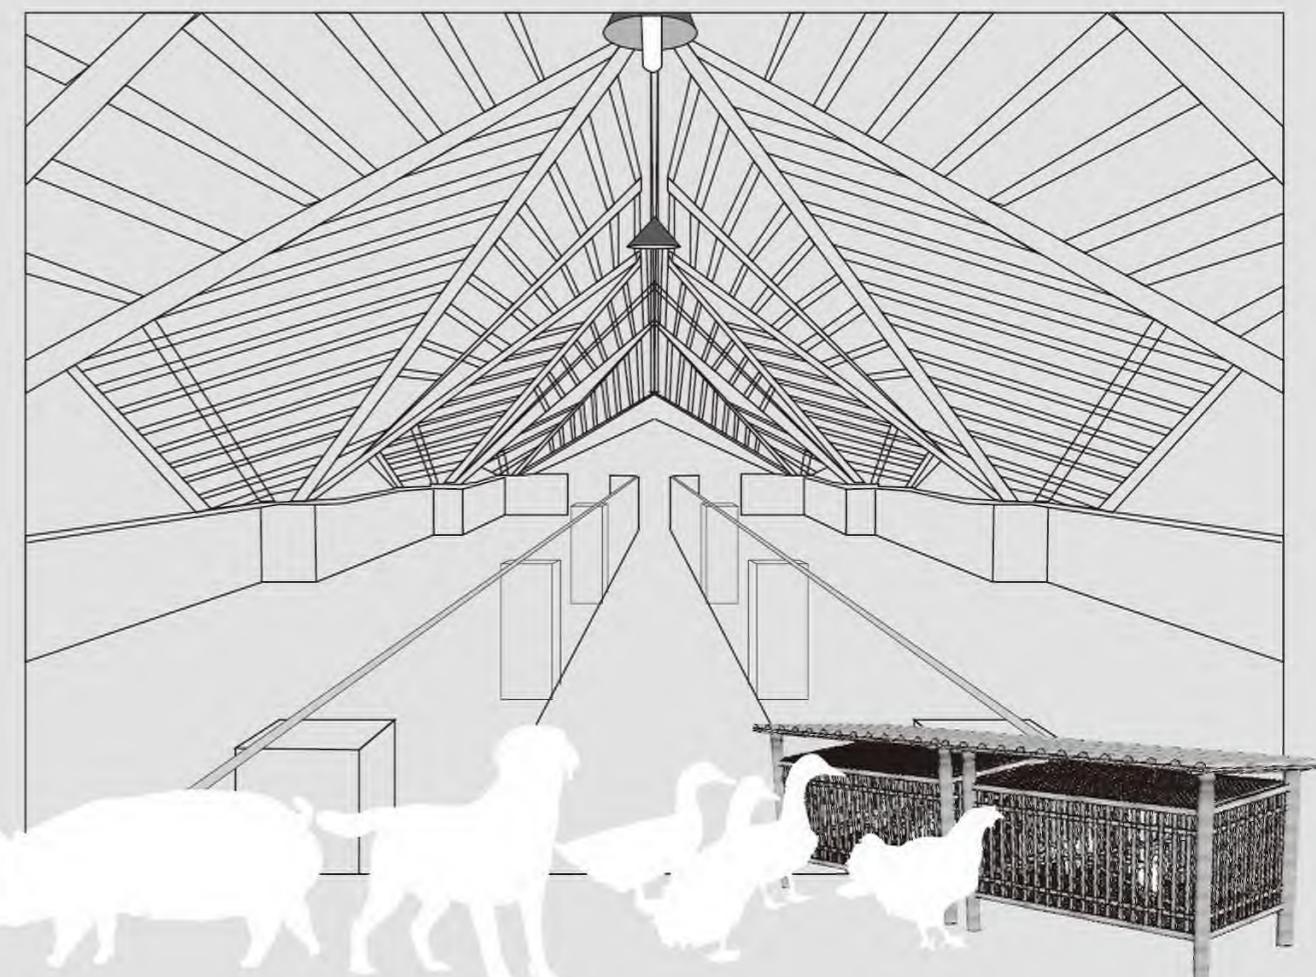

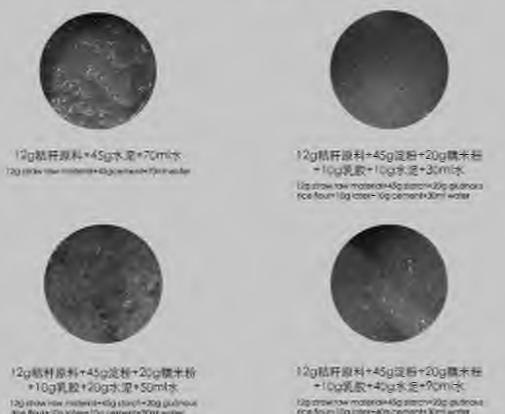

#### 农业与乡村养殖 / Agriculture and rural farming

秸秆材料相关的农作物种植量与农业养殖的体量分布在全国农业发达的区域有极高的相似性。养殖畜牧业做为农业的一部分，是与农作物种植成正相关的关系。  
The planting volume of crops related to straw materials and the volume of agricultural breeding are very similar in the areas with developed agriculture. As part of agriculture, animal husbandry has a positive relationship with crop cultivation.

#### 养箱蜂 / Beehive

养蜂场所的环境条件与养蜂的成败及蜂产品的产量密切相关，所以应选择蜜源丰富、环境适宜的地方建立蜂场。  
The environmental conditions of beekeeping sites are closely related to the success or failure of beekeeping and the output of bee products. Therefore, bee farms should be established in places with rich nectar sources and suitable environments.

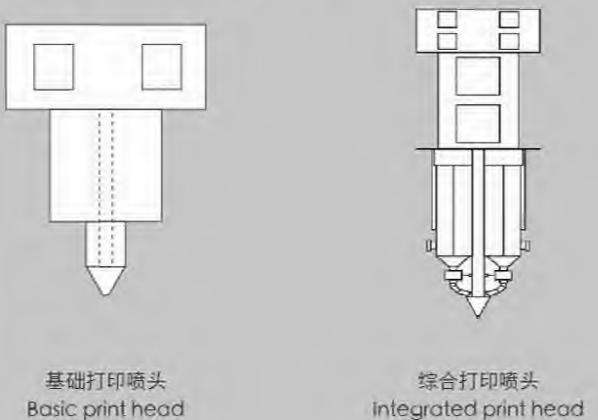

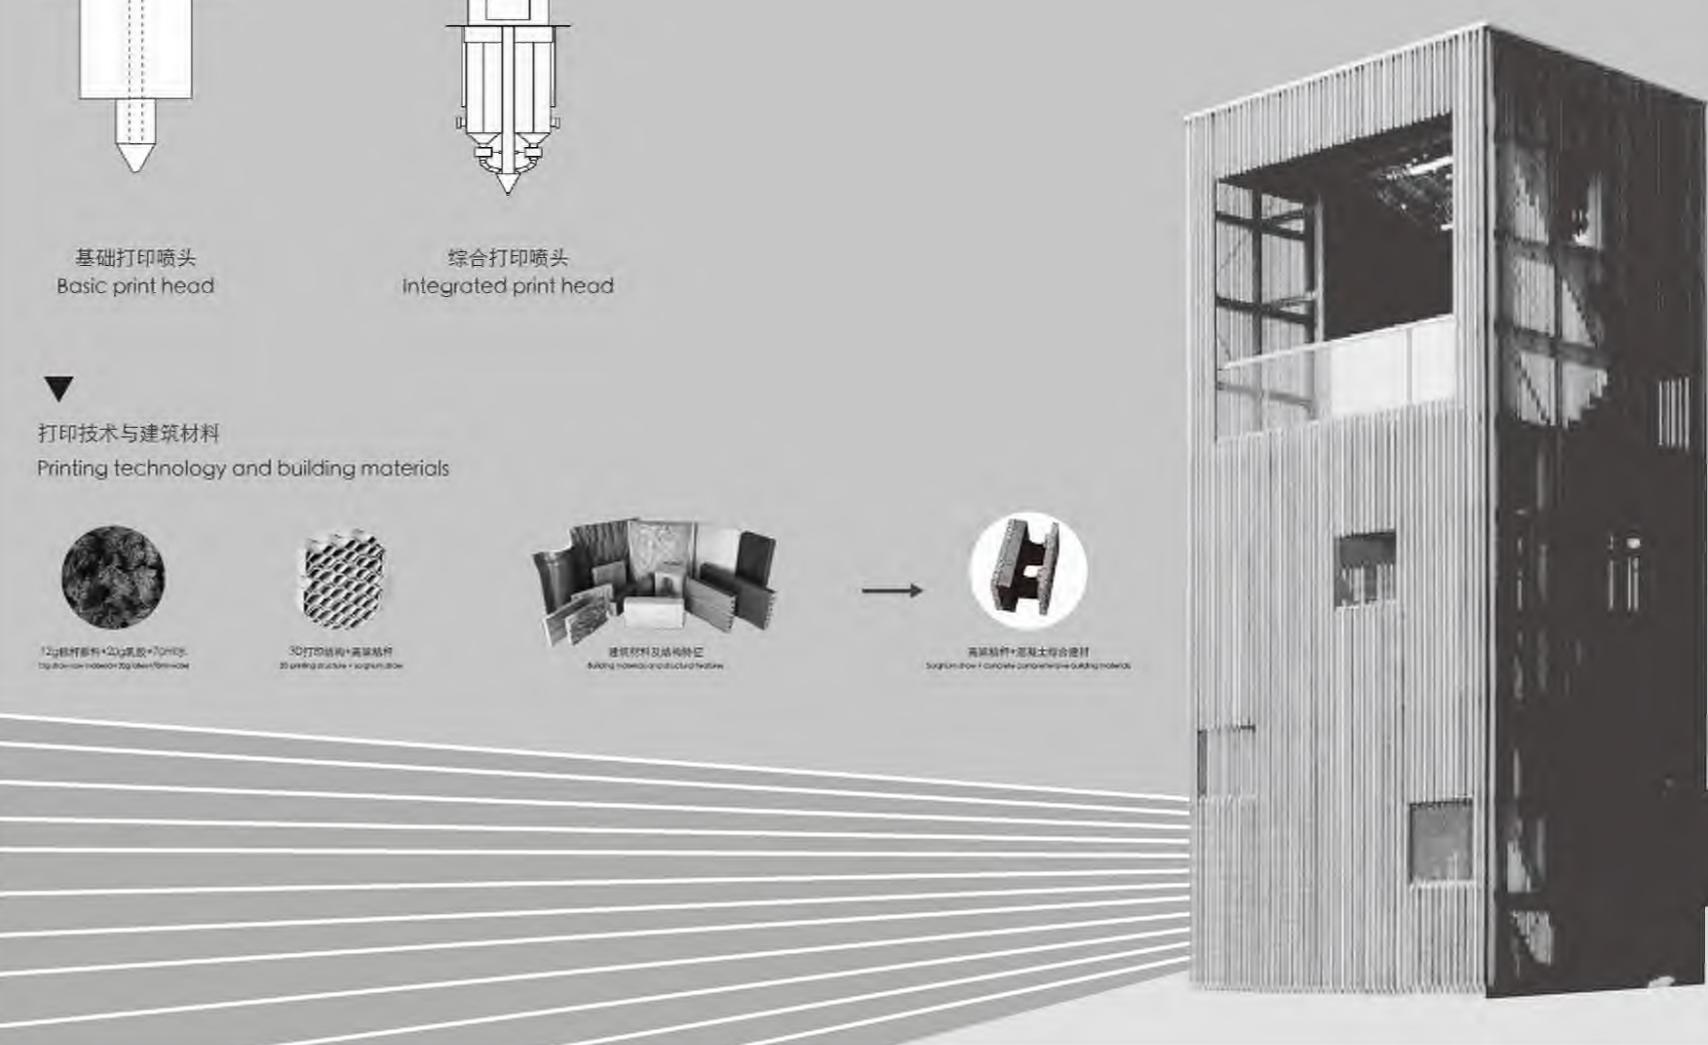

当秸秆材料实验中加入适量水泥时，我们发现其干燥的时间巨幅增加，同时其抗压性测试强度也大幅增加，能够在与秸秆材料相配合的情况下做为建筑材料来使用。

## Blue circular economy of sorghum —3D printing experiment of simulated sorghum straw

### “高粱节”

中国传统节日，俗称“节节高”，节期在每年农历八月十三日。主要流行于我国北方。高粱节是我国盛大节日之一，这天人们会把丰收的高粱的籽粒部分酿制成高粱酒及其它食材，将高粱的秸秆叶片等通过碾碎以及加入水、高粱淀粉等一系列作业，通过3D打印机生成节日所需的一切物品，遵循节日最大特点“一切来源于高粱”，并相聚在一起庆祝丰收的喜悦在节日当天。经年传承逐渐成为家喻户晓的节日。

### "Sorghum Festival"

Chinese traditional festival, commonly known as "jiejiegao", falls on August 13 of the lunar calendar every year. It is mainly popular in the north of China. Sorghum Festival is one of the grand festivals in China. On this day, people will brew sorghum grains into sorghum wine and other food materials, crush sorghum straw leaves, add water, sorghum starch and other operations, generate all the items needed for the festival through 3D printer, follow the biggest feature of the festival "everything comes from Sorghum", and get together to celebrate the festival. The joy of harvest is on the day of the festival. After years of inheritance, it has gradually become a well-known Festival.

### 高粱饭盒

利用秸秆的特性来打造可循环节约材料，制作无污染可循环节约型的3d打印高粱餐具。

### Sorghum lunch box

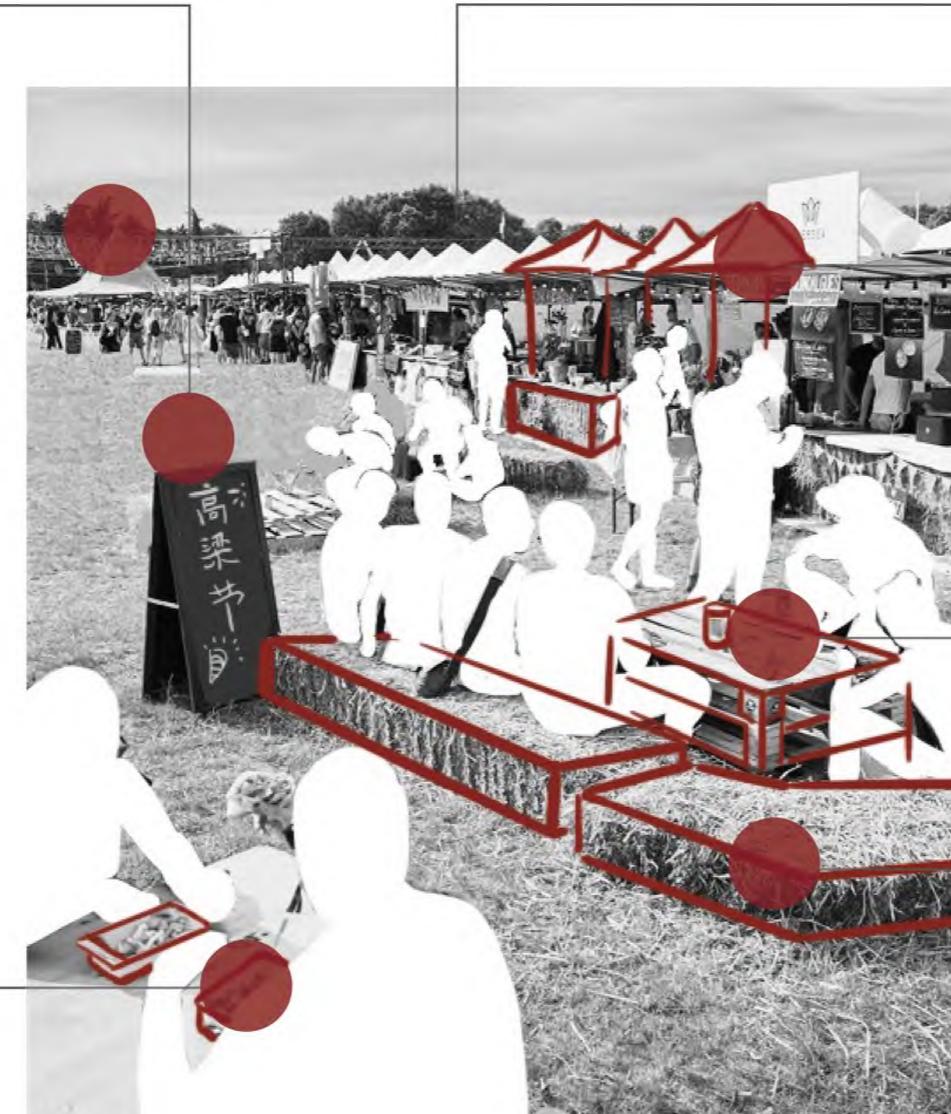

The characteristics of straw are used to create recyclable and economical materials, and to produce pollution-free recyclable and economical sorghum 3D printing tableware.

### 高粱食物

将高粱进行炊饭或磨制成粉后再做成其他各种食品。

### Sorghum food

Sorghum will be cooked or ground into powder, and then made into other kinds of food.

### 高粱简易建筑

高粱秸秆与水泥、混凝土的混合打印，形成层次粉末，功能综合、造型可变的基础建筑原料，建造乡民所需简易建筑。

### Simple sorghum architecture

The mixed printing of sorghum straw, cement and concrete forms layered powder, basic building materials with comprehensive functions and variable shape, which can build simple buildings needed by villagers.

### 高粱遮阳伞

充分发挥高粱秸秆能够起到遮挡阳光的作用，达到物尽其用的效果。

### Sorghum umbrella

Full use of sorghum straw can block sunlight, To achieve the best use of the effect.

### 高粱酒

以高粱为原料制作的白酒以其色、香、味和风格展现了我国酒文化的深厚底蕴。

### Sorghum liquor

The liquor made with sorghum as raw material shows the profound details of liquor culture in China with its color, aroma, taste and style.

### 高粱纸杯

以秸秆为原材料，进行3d打印的环保纸杯。

### Sorghum paper cup

Green paper cup with straw 3D printing

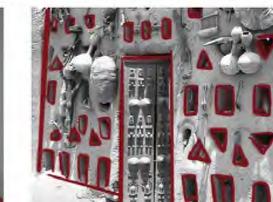

### 高粱凳子

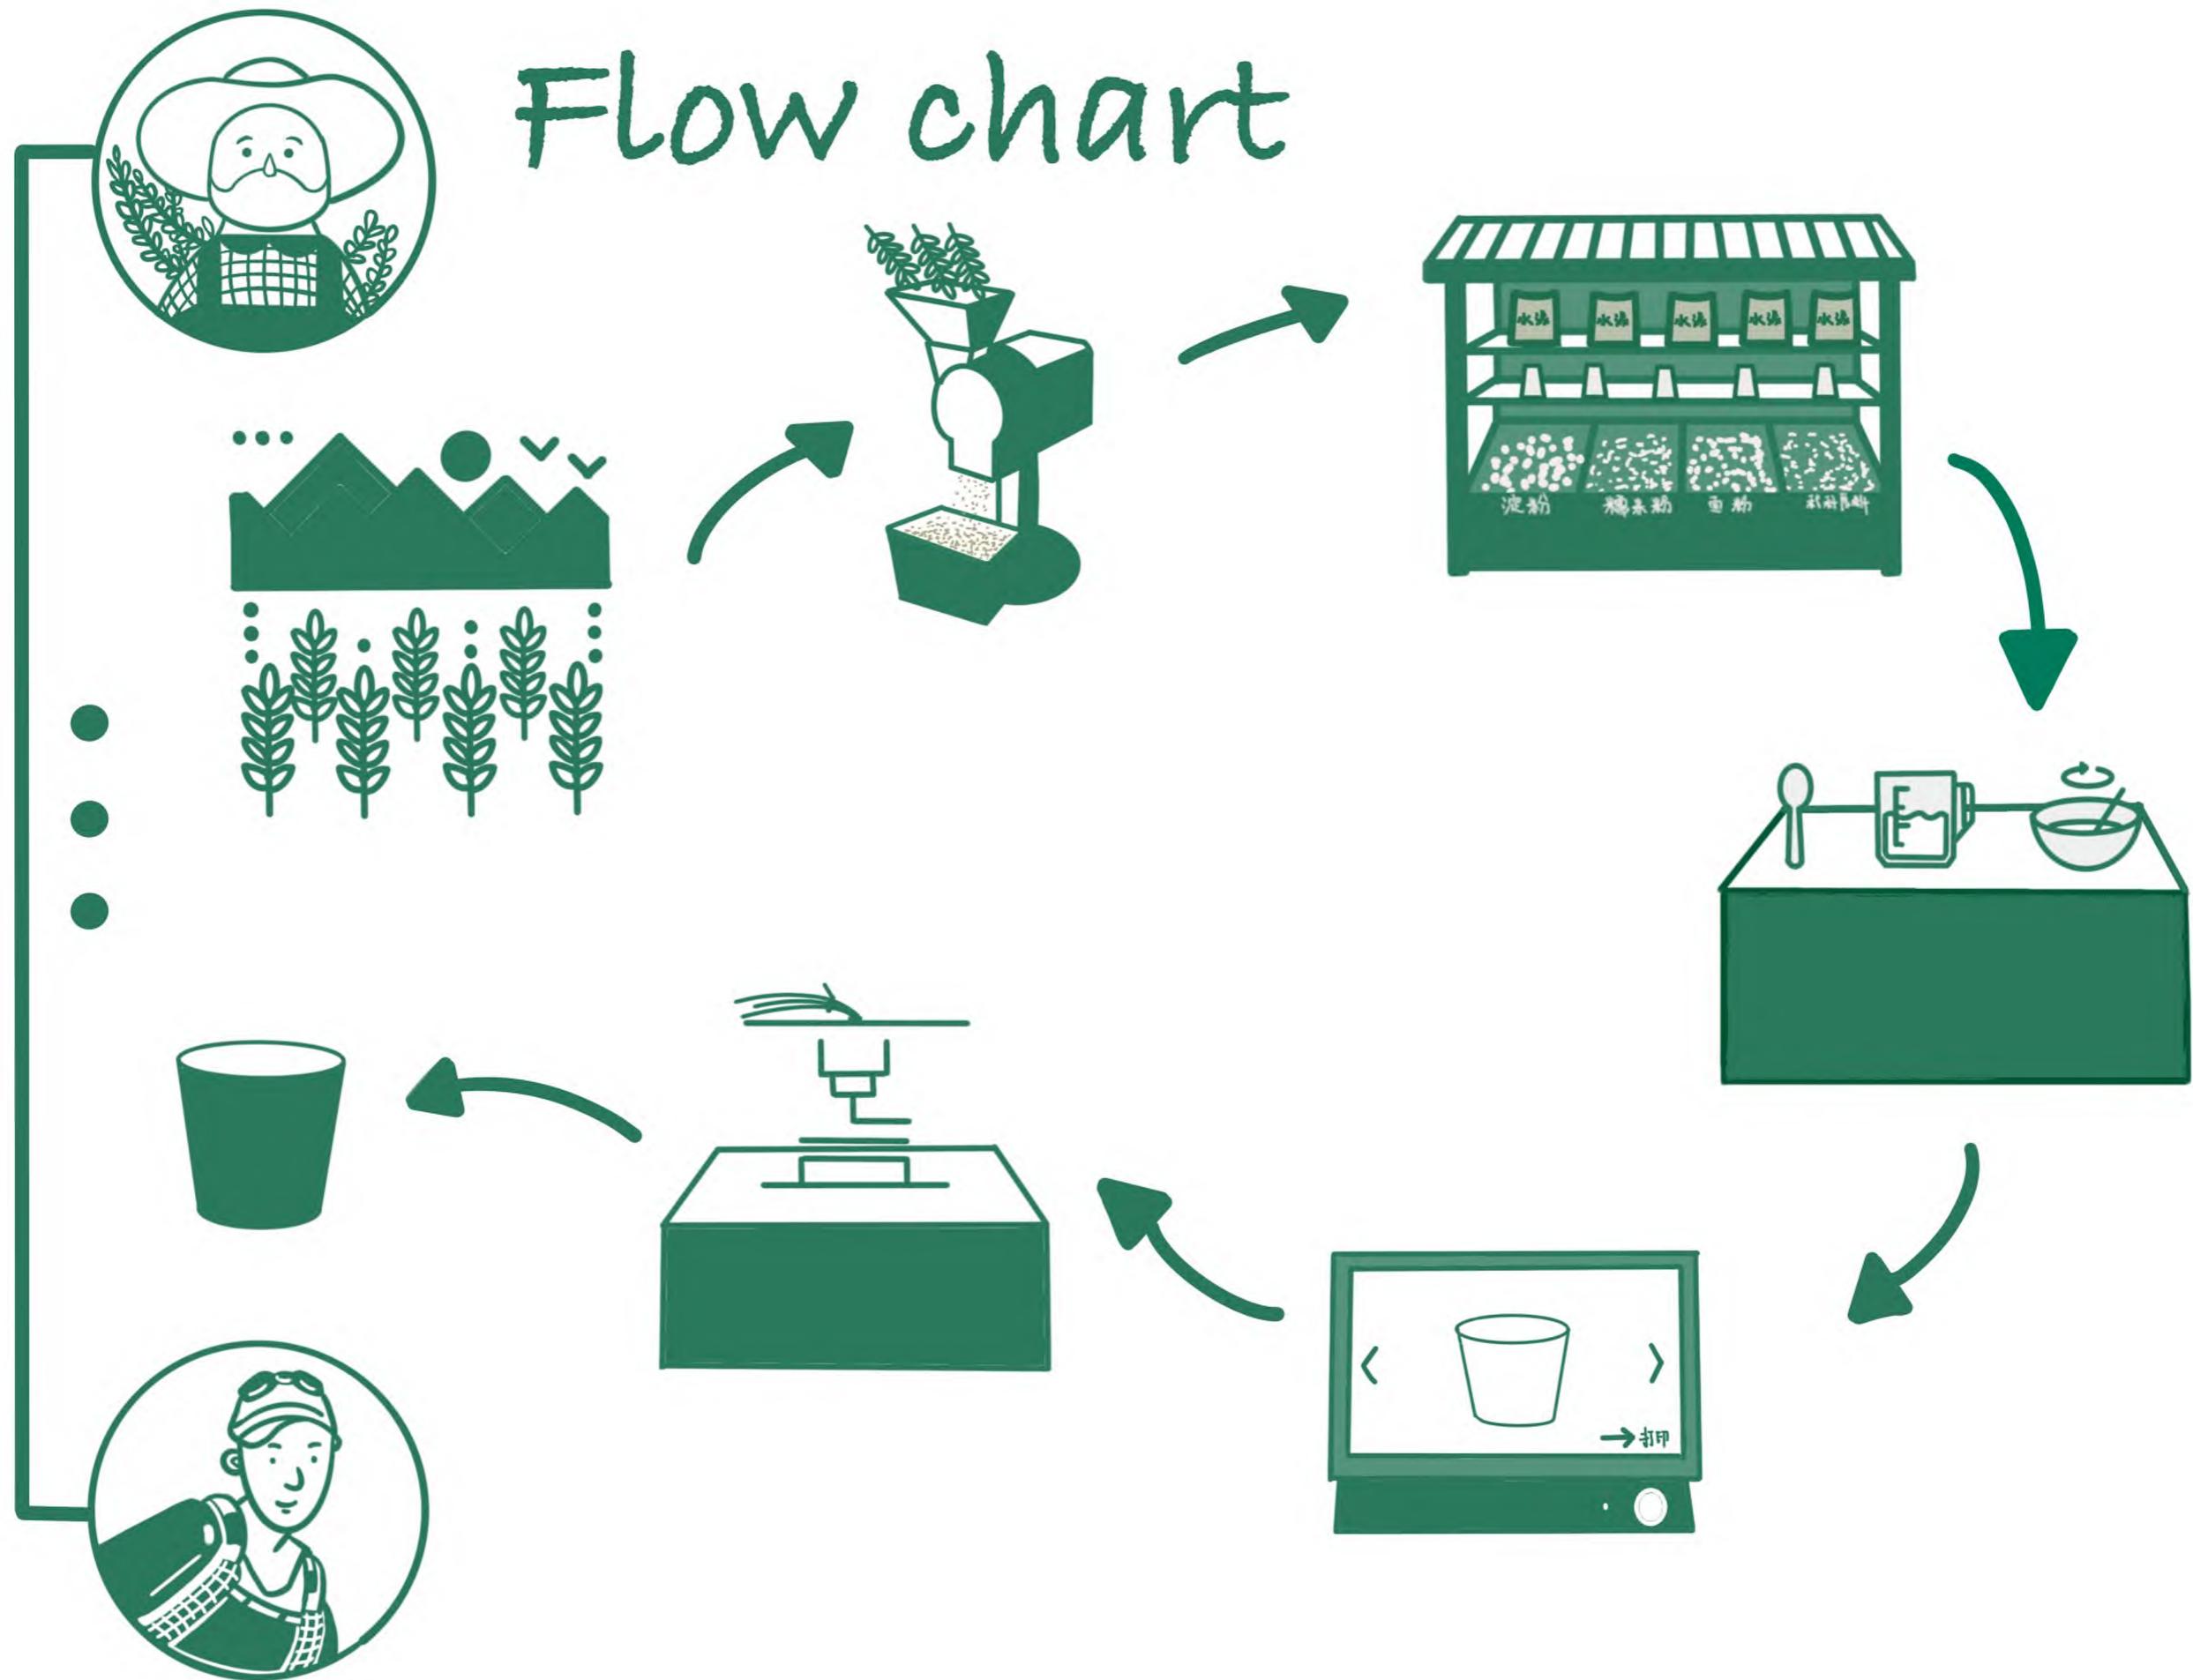

收集大量秸秆进行挤压组合，通过加入一些提升抗压性的材料，进行3d打印，提升生产效率。

### Sorghum stool

A large number of straw was collected for extrusion combination, and the production efficiency was improved by adding some materials to improve the compression resistance.
